

Composite Fibre

Structural boardwalk material

Composite Fibre together with Enduroplank™ recycled plastic planks is the sustainable solution for maintenance free non wooden pedestrian bridge and boardwalk applications.

Composite Fibre is stronger than steel, light weight and can span long distances. Less piers means less vegetation degradation, easier to install and the materials are straight and true to size.

Composite Fibre will last for over 40 years with no maintenance required, the product will not split, rot or be eaten by insects. When you combine the composite fibre with the enduroplank™ you have a structure that is easy to build, sustainable and will outlast the alternative product many times over.
