

Recycled Plastic Fenders & Wales

Replas has developed equipment that allows production of Recycled Plastic wharf and jetty components of a high standard and reasonable cost. The material used is waste plastic diverted from landfill. The units can be made up to a weight of 550 Kg, in a range of rectangular sections.

The plastic fenders and wales are replacements for the original timber components, some of which had a lifespan of approximately 5 years. It is expected that the recycled plastic units will have a life expectancy of 30 years, excepting mechanical damage. The use of recycled plastic in this and similar situations will significantly contribute to reduced volumes of material now being disposed of in land fill.
