

**Step 1:** Drill holes in the feet of the support that is suitable for the chosen fixing system.  
(the positions for the fixings are shown in the picture above)

**Step 2:** Drill the hole as close to the upright as practical and positioned equidistant from the outside edge.

**Step 3:** Using the holes drilled in the support as a template, drill a pilot hole to the flooring that the seats is to be mounted onto, ideally this should be done whilst drilling the holes in the support.

**Step 4:** Using the pilot holes as marked on the mounting surface, drill holes into the flooring that are suitable to hold the fixing system chosen.

**Step 5:** Place the seat on top of the holes drilled.

**Step 6:** Apply the fixing system through the supports and into the floor.

**Step 7:** Do up the fixing system so that the seat is both securely and firmly held.
