

There are two methods for laying Enduroplank™ which can create two different effects.

- Line Effect: Laying the planks so that a continuous vertical line is achieved.
- Pattern Effect: Created by alternating every second plank.

**Line Effect**

**Pattern Effect**

## Line Effect

Traditionally Enduroplank™ has been laid so that the lines between the fins lined up.

This technique can result in a less aesthetically pleasing result as it is not always possible to have the planks perfectly aligned due to the expansion / contraction of Enduroplank™ as it cools during manufacturing, the ends of the planks can cool faster than the middle. This can result in a slight variation in the measurements of each plank. As a consequence, it can be difficult to lay Enduroplank™ in a straight line.

This problem is greatly reduced the smaller the length of the plank. 1.5 metre lengths of Enduroplank™ are less likely to display this problem than 3.5 metre lengths. Due to this issue we do not recommend this method.

## Pattern Effect

The pattern effect is the recommended way to lay Enduroplank™. Any variation in measurement between planks will not be noticed using this method.

Please visit our website [www.replas.com.au](http://www.replas.com.au) to view our online instructional videos.

These can be found under our News and Multimedia section and offer many handy tips on the installation of Enduroplank™ and the best use of tools.

## Useful Hints

Once formed Enduroplank™ will not cup, as a result only one fixing is required to secure the plank. Two fixings can be placed in the centre of the plank just to ensure the plank is held tightly in place. See the website for further details.

Enduroplank™ has expansion / contraction issues length wise, but not width wise. It is most commonly laid with a 5 mm gap between planks. This facilitates drainage and airflow; however it is possible to lay Enduroplank™ without any gaps between planks should this method be preferred.
